

UAB "Rodiklis" offers production services of neon advertising items. According to custom-made orders we have been producing the following: illuminated signs; illumination systems for 3D letters; systems for illuminating some parts in buildings, ships and motor vehicles. The process of production applied by us involves only high quality materials. For the items produced guarantee is available.

Illuminated glass tubes filled with neon or inert gas of the neon-argon mixture are considerably more efficient and reliable source of light compared to incandescent or luminescent lamps. Illuminated glass tubes feature such advantages as lower power consumption, brighter light, higher resistance to aggressive environments (frost, snow, rain), longer service life and greater variety of colours. High voltage is supplied by 220V, 24V and 12V network.

Price of neon advertising items depends upon the following factors: tube diameter, colour, length of the illuminated part. Neon lamps in white colour (usually used for illumination of 3D letters and lightboxes) and neon lamps with a transparent tube are most inexpensive: the price for 1 m starts from EUR 15 without VAT (for more detailed pricelist see Annex). For advertising agencies discounts are available.
